Machine-Level Programming III: Procedures

Introduction to Computer Systems 6th Lecture, Sep. 30, 2021

Instructors:

Class 1: Chen Xiangqun, Sun Guangyu, Liu Xianhua

Class 2: Guan Xuetao

Class 3: Lu Junlin

Objectives

- Basic functionality of the pairs: push / pop and call / ret
- Students should be able to identify the different components of a stack (return address, arguments, saved registers, local variables)
- Explain the difference between callee and caller save registers
- Explain how a stack permits functions to be called recursively / re-entrant

Today

- Procedures
 - Mechanisms
 - Stack Structure
 - Calling Conventions
 - Passing control
 - Passing data
 - Managing local data
 - Illustration of Recursion

Passing control

- To beginning of procedure code
- Back to return point

Passing data

- Procedure arguments
- Return value

Memory management

- Allocate during procedure execution
- Deallocate upon return
- Mechanisms all implemented with machine instructions
- x86-64 implementation of a procedure uses only those mechanisms required

- Passing control
 - To beginning of procedure code
 - Back to return point
- Passing data
 - Procedure arguments
 - Return value
- Memory management
 - Allocate during procedure execution
 - Deallocate upon return
- Mechanisms all implemented with machine instructions
- x86-64 implementation of a procedure uses only those mechanisms required

```
P(...) {
      Q(x);
  print(y)
    Q(int i)
  int t = 3*i;
  int v[10];
  return v[t];
```

Passing control

- To beginning of procedure code
- Back to return point

Passing data

- Procedure arguments
- Return value

Memory management

- Allocate during procedure execution
- Deallocate upon return
- Mechanisms all implemented with machine instructions
- x86-64 implementation of a procedure uses only those mechanisms required

```
P(...) {
    = Q(x);
  print(y)
int Q(\nt i)
        = 3*i;
  int t
  int v[10];
  return v[t];
```

Passing control

- To beginning of procedure code
- Back to return point

Passing data

- Procedure arguments
- Return value

Memory management

- Allocate during procedure execution
- Deallocate upon return
- Mechanisms all implemented with machine instructions
- x86-64 implementation of a procedure uses only those mechanisms required

```
int Q(int i)
{
   int t = 3*i;
   int v[10];
   return v[t];
}
```

P(...) {

Machine instructions implement the mechanisms, but the choices are determined by designers. These choices make up the **Application Binary Interface** (ABI).

- Deallocate upon return
- Mechanisms all implemented with machine instructions
- x86-64 implementation of a procedure uses only those mechanisms required

```
int v[10];
•
return v[t];
}
```

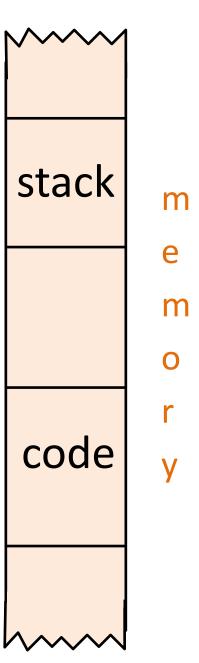

Today

Procedures

- Mechanisms
- Stack Structure
- Calling Conventions
 - Passing control
 - Passing data
 - Managing local data
- Illustration of Recursion

x86-64 Stack

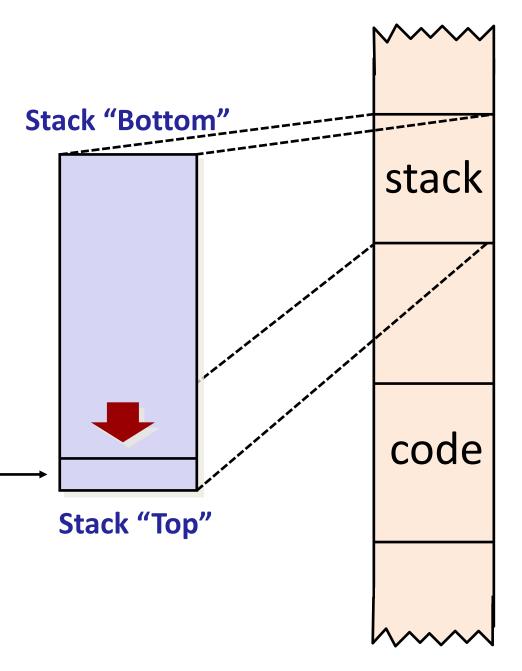

- Region of memory managed with stack discipline
 - Memory viewed as array of bytes.
 - Different regions have different purposes.
 - (Like ABI, a policy decision)

x86-64 Stack

Region of memory managed with stack discipline

Stack Pointer: %rsp

x86-64 Stack

- Region of memory managed with stack discipline
- Grows toward lower addresses
- Register %rsp contains lowest stack address
 - address of "top" element

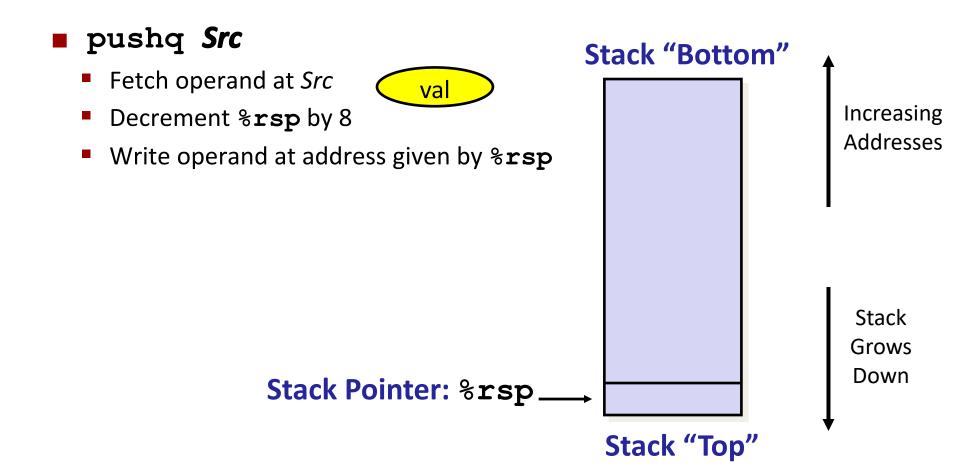

sp contains
ck address
top" element

Stack Grows
Down

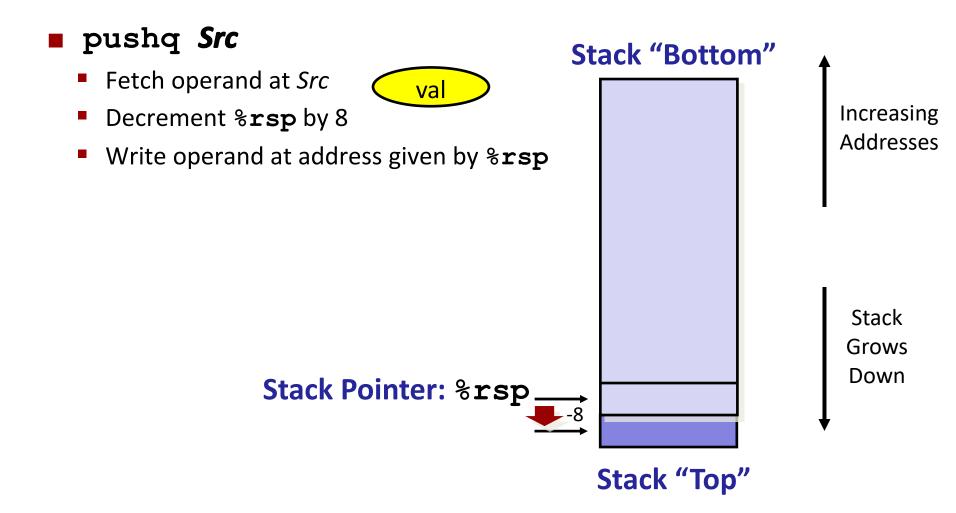

Stack "Top"

Stack "Bottom"

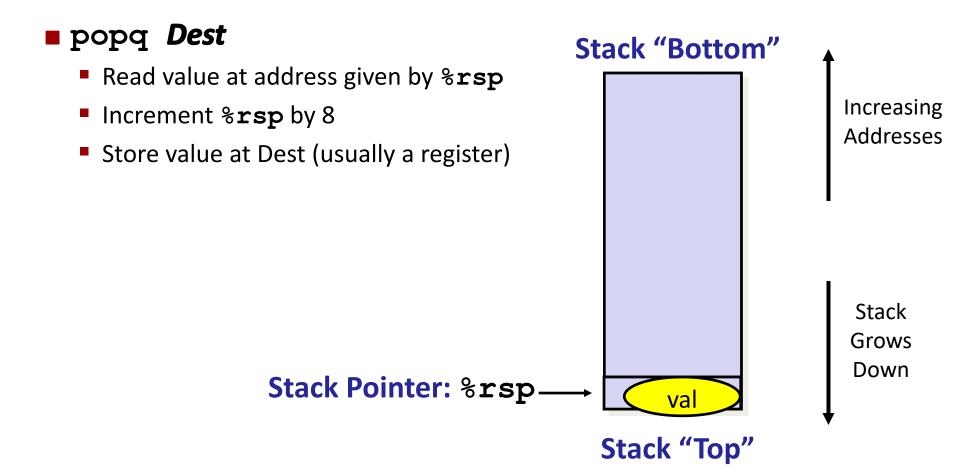

x86-64 Stack: Push

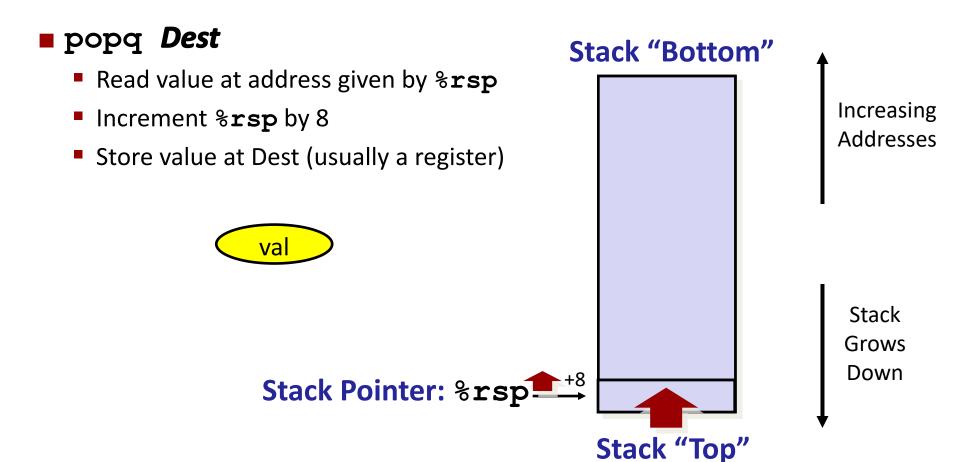

x86-64 Stack: Push

x86-64 Stack: Pop

x86-64 Stack: Pop

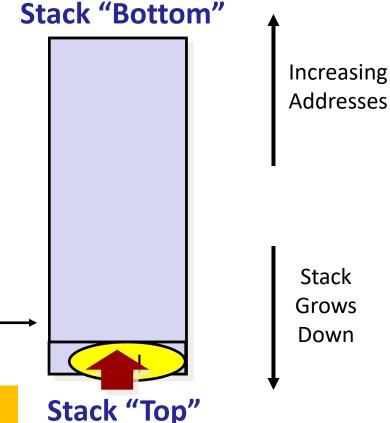

x86-64 Stack: Pop

■ popq *Dest*

- Read value at address given by %rsp
- Increment %rsp by 8
- Store value at Dest (usually a register)

Stack Pointer: %rsp-----

(The memory doesn't change, only the value of %rsp)

Today

Procedures

- Mechanisms
- Stack Structure
- Calling Conventions
 - Passing control
 - Passing data
 - Managing local data
- Illustration of Recursion

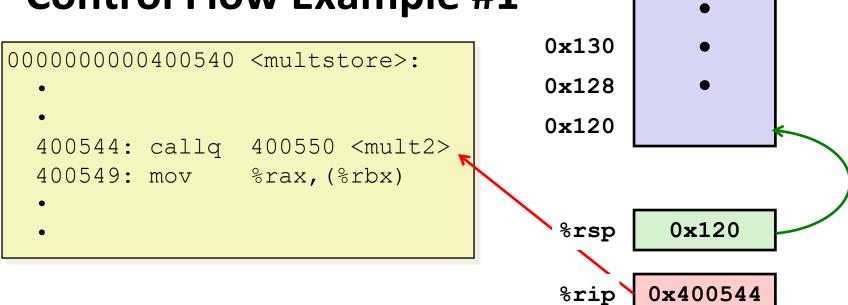

```
long mult2 (long a, long b)
{
  long s = a * b;
  return s;
}

400550: mov %rdi,%rax # a
  400553: imul %rsi,%rax # a * b
  400557: retq # Return
```

Procedure Control Flow

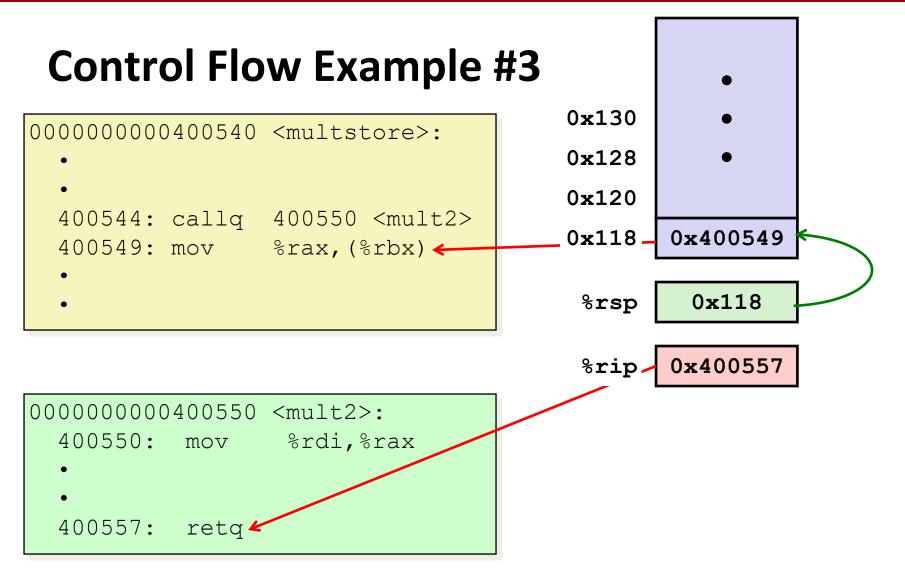

- Use stack to support procedure call and return
- Procedure call: call label
 - Push return address on stack
 - Jump to label
- Return address:
 - Address of the next instruction right after call
 - Example from disassembly
- Procedure return: ret
 - Pop address from stack
 - Jump to address

Control Flow Example #1

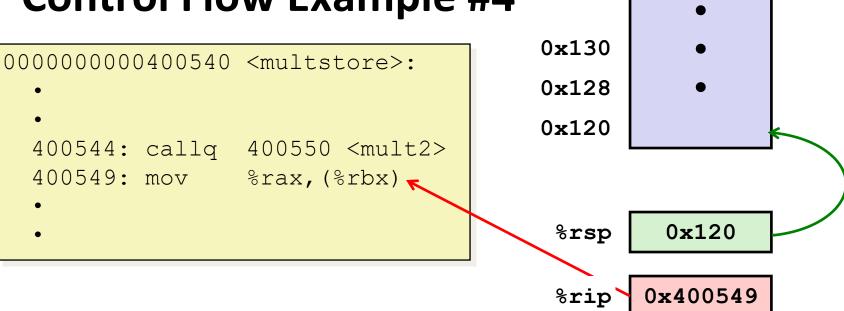

```
0000000000400550 <mult2>:
   400550: mov %rdi,%rax
   •
   400557: retq
```

Control Flow Example #2 0x1300000000000400540 <multstore>: 0x1280x120400544: callq 400550 <mult2> 0×400549 0x118. 400549: mov %rax, (%rbx) ← 0x118 %rsp 0×400550 %rip. 0000000000400550 <mult2>: 400550: mov %rdi,%rax < 400557: retq

Control Flow Example #4

```
0000000000400550 <mult2>:
   400550: mov %rdi,%rax
   •
   400557: retq
```

Today

Procedures

- Mechanisms
- Stack Structure
- Calling Conventions
 - Passing control
 - Passing data
 - Managing local data
- Illustrations of Recursion & Pointers

Procedure Data Flow

Registers

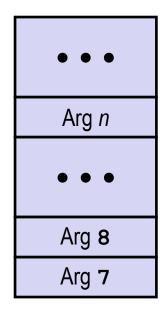

First 6 arguments

Return value

Stack

Only allocate stack space when needed

Data Flow Examples

```
void multstore
  (long x, long y, long *dest)
{
    long t = mult2(x, y);
    *dest = t;
}
```

```
long mult2
  (long a, long b)
{
  long s = a * b;
  return s;
}
```

```
000000000000400550 <mult2>:
    # a in %rdi, b in %rsi
400550: mov %rdi,%rax # a
400553: imul %rsi,%rax # a * b
# s in %rax
400557: retq # Return
```

Today

Procedures

- Mechanisms
- Stack Structure
- Calling Conventions
 - Passing control
 - Passing data
 - Managing local data
- Illustration of Recursion

Stack-Based Languages

Languages that support recursion

- e.g., C, Pascal, Java
- Code must be "Reentrant"
 - Multiple simultaneous instantiations of single procedure
- Need some place to store state of each instantiation
 - Arguments
 - Local variables
 - Return pointer

Stack discipline

- State for given procedure needed for limited time
 - From when called to when return
- Callee returns before caller does

Stack allocated in *Frames*

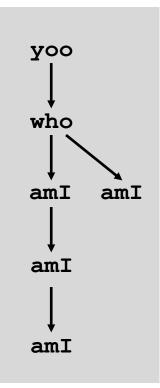

state for single procedure instantiation

Call Chain Example

```
who(...)
{
    amI();
    amI();
    amI();
}
```

Procedure amI () is recursive

Example Call Chain

Stack Frames

Contents

- Return information
- Local storage (if needed)
- Temporary space (if needed)

Previous Frame

Frame Pointer: %rbp (Optional)

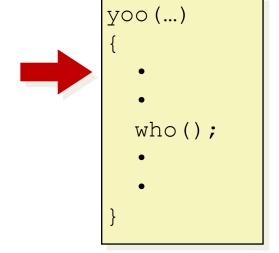

Stack Pointer: %rsp

Frame for proc

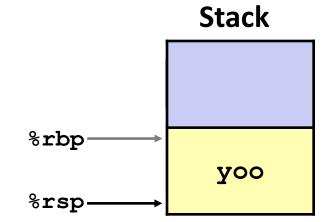

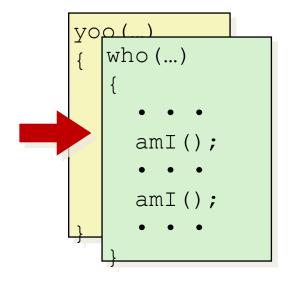

Management

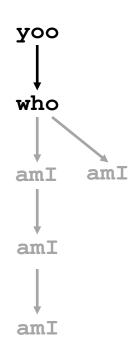

- Space allocated when enter procedure
 - "Set-up" code
 - Includes push by call instruction
- Deallocated when return
 - "Finish" code
 - Includes pop by ret instruction

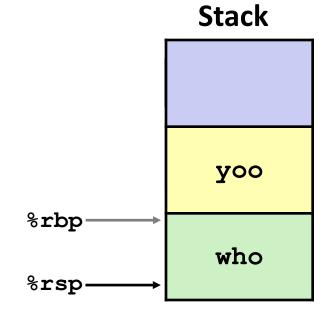

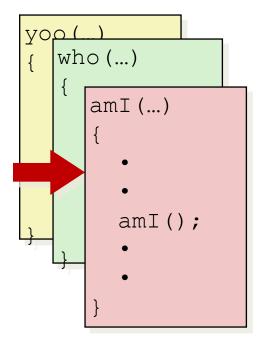

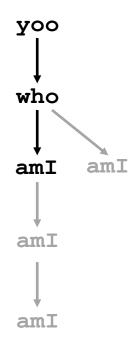

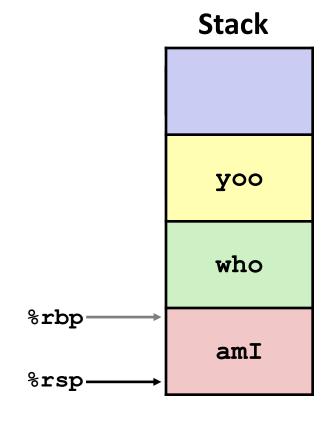

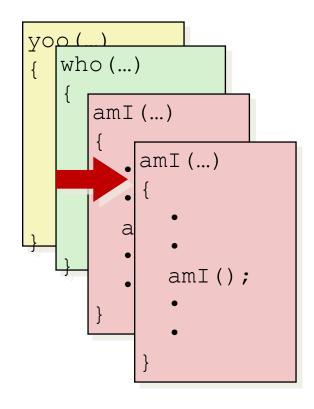

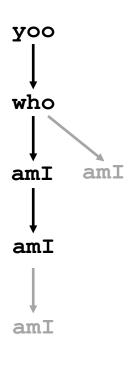

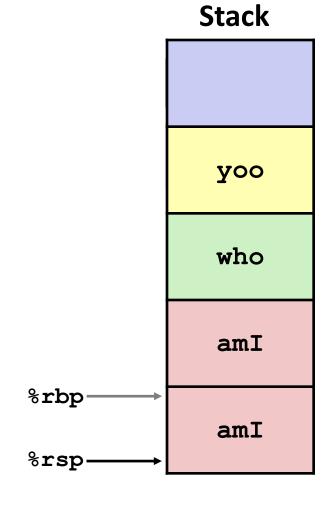

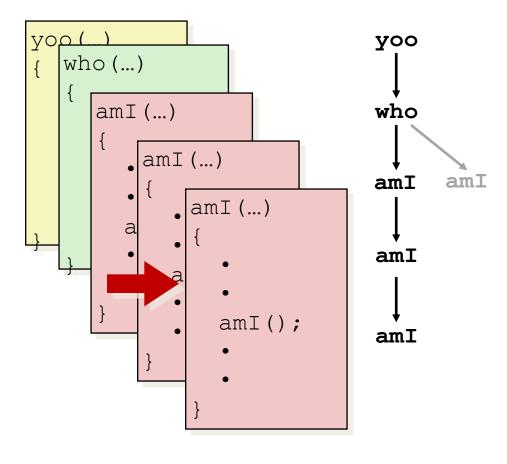

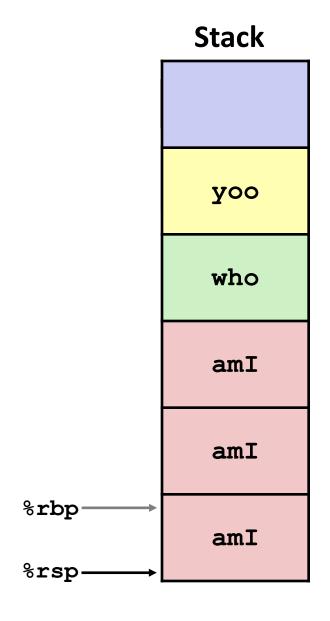

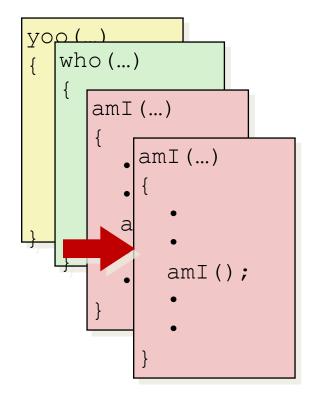

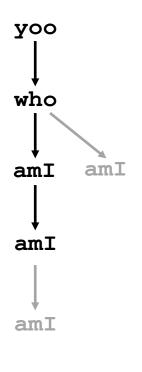

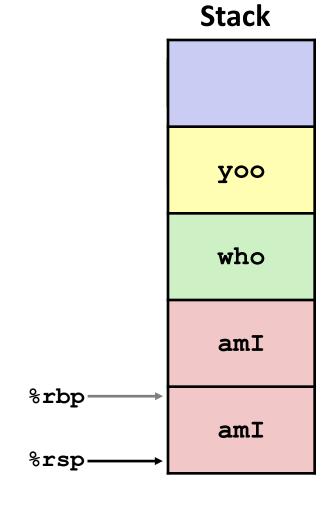

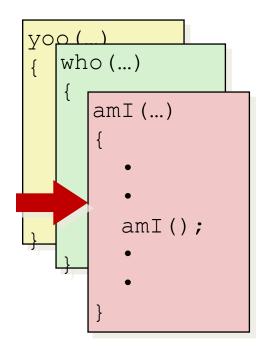

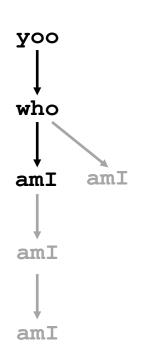

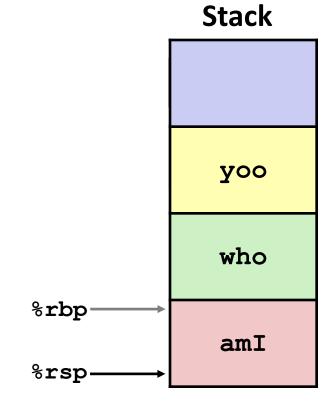

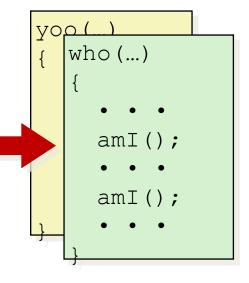

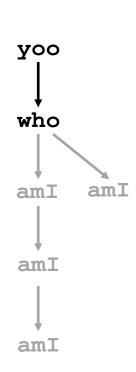

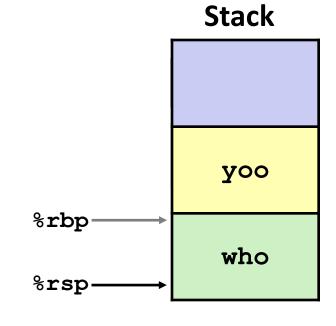

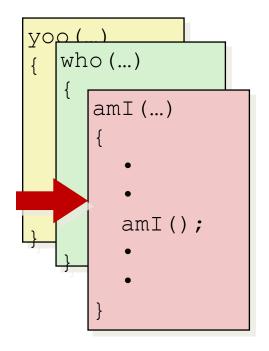

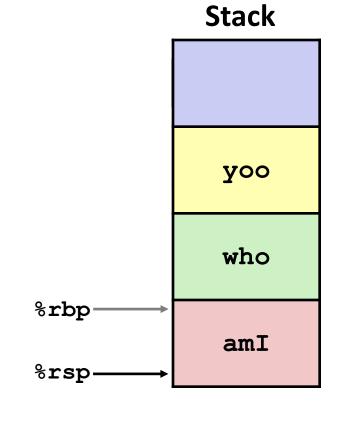

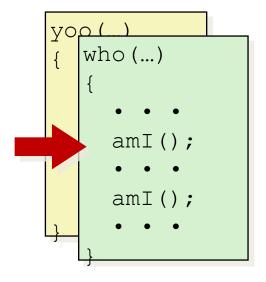

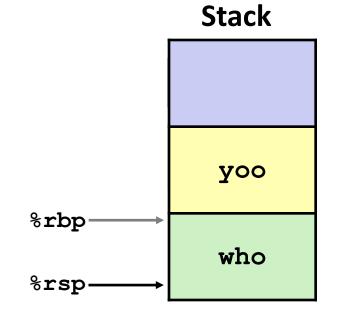

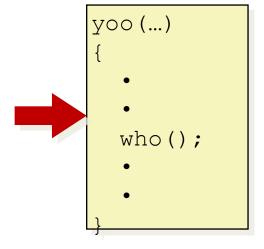

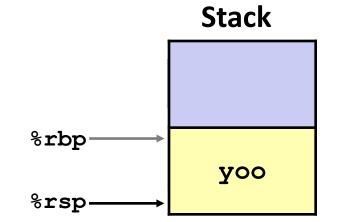

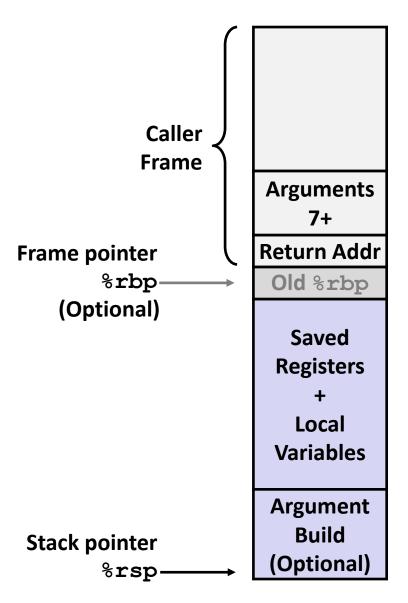

x86-64/Linux Stack Frame

Current Stack Frame ("Top" to Bottom)

- "Argument build:"
 Parameters for function about to call
- Local variablesIf can't keep in registers
- Saved register context
- Old frame pointer (optional)

Caller Stack Frame

- Return address
 - Pushed by call instruction
- Arguments for this call

Example: incr

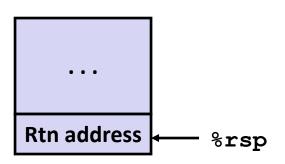

```
long incr(long *p, long val) {
   long x = *p;
   long y = x + val;
   *p = y;
   return x;
}
```

```
incr:
  movq (%rdi), %rax
  addq %rax, %rsi
  movq %rsi, (%rdi)
  ret
```

Register	Use(s)
%rdi	Argument p
%rsi	Argument val, y
%rax	x , Return value

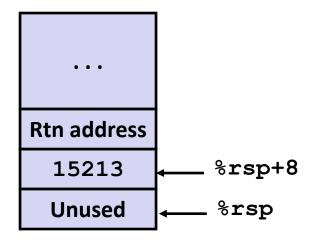

long call_incr() { long v1 = 15213; long v2 = incr(&v1, 3000); return v1+v2; }

Initial Stack Structure

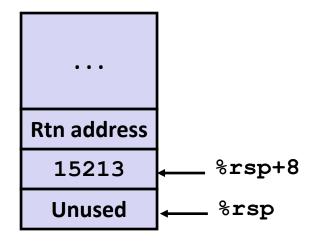

```
call_incr:
    subq    $16, %rsp
    movq    $15213, 8(%rsp)
    movl    $3000, %esi
    leaq    8(%rsp), %rdi
    call    incr
    addq    8(%rsp), %rax
    addq    $16, %rsp
    ret
```

Resulting Stack Structure

```
long call_incr() {
    long v1 = 15213;
    long v2 = incr(&v1, 3000);
    return v1+v2;
}
```

```
call_incr:
    subq $16, %rsp
    movq $15213, 8(%rsp)
    movl $3000, %esi
    leaq 8(%rsp), %rdi
    call incr
    addq 8(%rsp), %rax
    addq $16, %rsp
    ret
```

Register	Use(s)
%rdi	&v1
%rsi	3000

```
long call_incr() {
    long v1 = 15213;
    long v2 = incr(&v1, 3000);
    return v1+v2;
}
```

Stack Structure

```
Rtn address
```

```
Aside 1: movl $3000, %esi
```

• Note: movl -> %exx zeros out high order 32 bits.

Why use movl instead of movq? 1 byte shorter.

```
movl $3000, %esi
leaq 8(%rsp), %rdi
call incr
addq 8(%rsp), %rax
addq $16, %rsp
ret
```

mov

%rdi	&v1
%rsi	3000

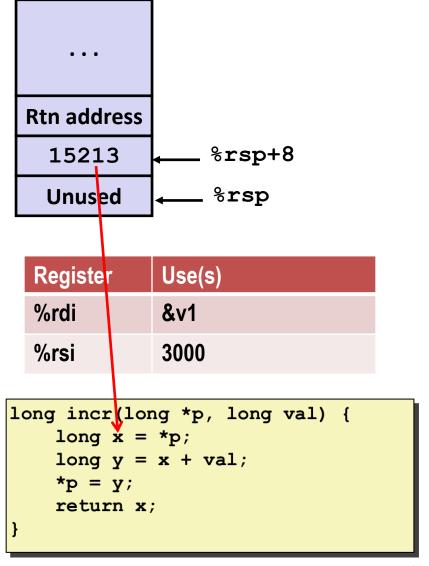

```
Stack Structure
long call incr() {
    long v1 = 15213;
    long v2 = incr(&v1, 3000);
    return v1+v2;
                                     Rtn address
                                                  %rsp+8
                                      15213
                                                  %rsp
       Aside 2: leaq 8 (%rsp), %rdi
ca:
  Computes %rsp+8
                                                se(s)

    Actually, used for what it is meant!

  leaq 8(%rsp), %rdi
                                     %rsi
                                              3000
 call incr
 addq 8(%rsp), %rax
 addq $16, %rsp
  ret
```

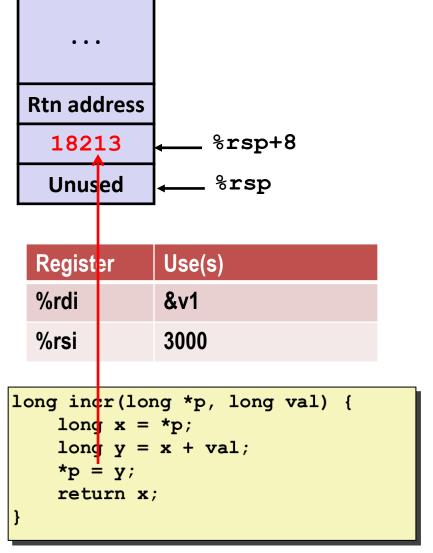

```
long call_incr() {
    long v1 = 15213;
    long v2 = incr(&v1, 3000);
    return v1+v2;
}
```

```
call_incr:
    subq    $16, %rsp
    movq    $15213, 8(%rsp)
    movl    $3000, %esi
    leaq    8(%rsp), %rdi
    call    incr
    addq    8(%rsp), %rax
    addq    $16, %rsp
    ret
```

```
long call_incr() {
    long v1 = 15213;
    long v2 = incr(&v1, 3000);
    return v1+v2;
}
```

```
call_incr:
    subq    $16, %rsp
    movq    $15213, 8(%rsp)
    movl    $3000, %esi
    leaq    8(%rsp), %rdi
    call    incr
    addq    8(%rsp), %rax
    addq    $16, %rsp
    ret
```

```
long call_incr() {
    long v1 = 15213;
    long v2 = incr(&v1, 3000);
    return v1+v2;
}
```

```
Rtn address

18213 ← %rsp+8

Unused %rsp
```

```
call_incr:
    subq    $16, %rsp
    movq    $15213, 8(%rsp)
    movl    $3000, %esi
    leaq    8(%rsp), %rdi
    call    incr
    addq    8(%rsp), %rax
    addq    $16, %rsp
    ret
```

	Register	Use(s)	
	%rax	Return value, 15213	
_			
1	ong incr(lor long x =	ng *p, long val) {	
	long y =		
	*p = y;	/	
	return x	;	
}			

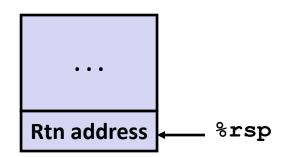

Stack Structure

```
long call_incr() {
    long v1 = 15213;
    long v2 = incr(&v1, 3000);
    return v1+v2;
}
```

call_incr	
subq	\$16, %rsp
movq	\$15213, 8(%rsp)
movl	\$3000, %esi
leaq	8(%rsp), %rdi
call	incr
addq	8(%rsp), %rax
addq	\$16, %rsp
ret	

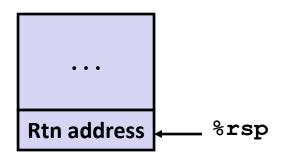

Register	Use(s)
%rax	Return value

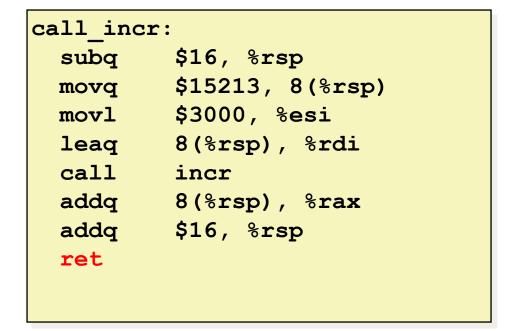

Updated Stack Structure

```
long call_incr() {
    long v1 = 15213;
    long v2 = incr(&v1, 3000);
    return v1+v2;
}
```

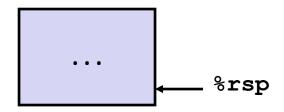

Updated Stack Structure

Register	Use(s)
%rax	Return value

Final Stack Structure

Register Saving Conventions

- When procedure yoo calls who:
 - yoo is the caller
 - who is the callee
- Can register be used for temporary storage?

```
yoo:

movq $15213, %rdx
call who
addq %rdx, %rax

ret
```

```
who:

• • •

subq $18213, %rdx

• • •

ret
```

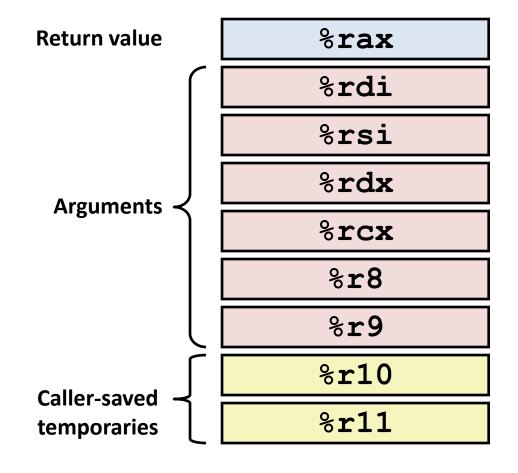

- Contents of register %rdx overwritten by who
- This could be trouble → something should be done!
 - Need some coordination

Register Saving Conventions

- When procedure yoo calls who:
 - yoo is the caller
 - who is the callee
- Can register be used for temporary storage?
- Conventions
 - "Caller Saved"
 - Caller saves temporary values in its frame before the call
 - "Callee Saved"
 - Callee saves temporary values in its frame before using
 - Callee restores them before returning to caller

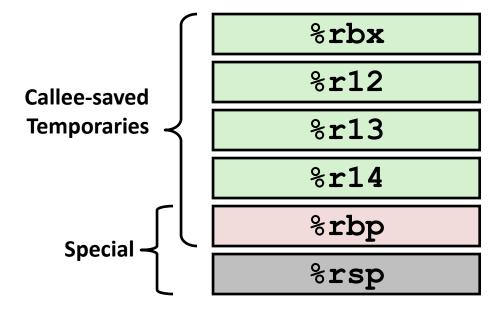

x86-64 Linux Register Usage #1

- %rax
 - Return value
 - Also caller-saved
 - Can be modified by procedure
- %rdi, ..., %r9
 - Arguments
 - Also caller-saved
 - Can be modified by procedure
- %r10,%r11
 - Caller-saved
 - Can be modified by procedure

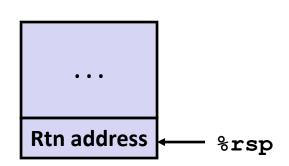

x86-64 Linux Register Usage #2

- %rbx, %r12, %r13, %r14
 - Callee-saved
 - Callee must save & restore
- %rbp
 - Callee-saved
 - Callee must save & restore
 - May be used as frame pointer
 - Can mix & match
- %rsp
 - Special form of callee save
 - Restored to original value upon exit from procedure

long call_incr2(long x) { long v1 = 15213; long v2 = incr(&v1, 3000); return x+v2; }

Initial Stack Structure

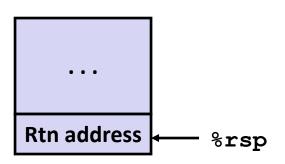

- x comes in register %rdi.
- We need %rdi for the call to incr.
- Where should be put x, so we can use it after the call to incr?

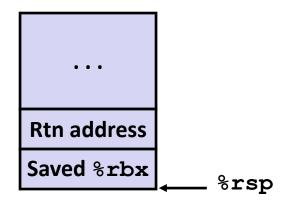

```
long call incr2(long x) {
    long v1 = 15213;
    long v2 = incr(&v1, 3000);
    return x+v2;
```

```
call incr2:
 pushq %rbx
 subq $16, %rsp
 movq %rdi, %rbx
 movq $15213, 8(%rsp)
 movl $3000, %esi
 leaq 8(%rsp), %rdi
 call incr
 addq %rbx, %rax
 addq $16, %rsp
 popq %rbx
 ret
```

Initial Stack Structure

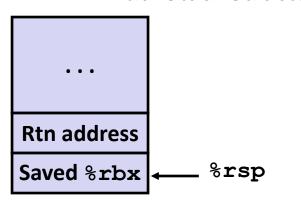

Resulting Stack Structure

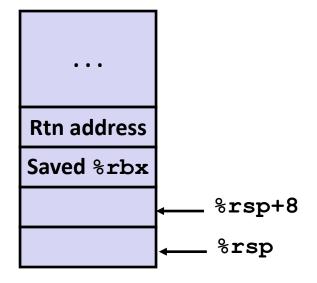

```
long call_incr2(long x) {
    long v1 = 15213;
    long v2 = incr(&v1, 3000);
    return x+v2;
}
```

```
call incr2:
 pushq %rbx
 subq $16, %rsp
 movq %rdi, %rbx
 movq $15213, 8(%rsp)
 movl $3000, %esi
 leaq 8(%rsp), %rdi
 call incr
 addq %rbx, %rax
 addq $16, %rsp
 popq %rbx
 ret
```

Initial Stack Structure

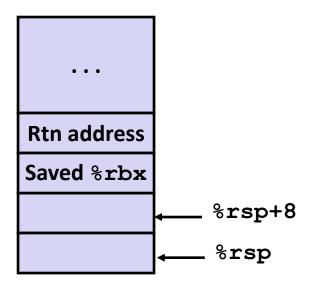

Resulting Stack Structure

```
long call_incr2(long x) {
    long v1 = 15213;
    long v2 = incr(&v1, 3000);
    return x+v2;
}
```

```
call incr2:
 pushq %rbx
 subq $16, %rsp
 movq %rdi, %rbx
 movq $15213, 8(%rsp)
 movl $3000, %esi
 leaq 8(%rsp), %rdi
 call
        incr
 addq %rbx, %rax
 addq $16, %rsp
 popq %rbx
 ret
```

Stack Structure

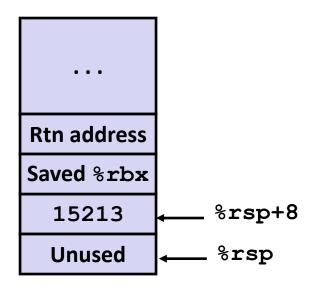

x is saved in %rbx,
 a callee saved register

```
long call_incr2(long x) {
    long v1 = 15213;
    long v2 = incr(&v1, 3000);
    return x+v2;
}
```

```
call incr2:
 pushq %rbx
 subq $16, %rsp
 movq %rdi, %rbx
 movq $15213, 8(%rsp)
 movl $3000, %esi
 leaq 8(%rsp), %rdi
 call
        incr
 addq %rbx, %rax
 addq $16, %rsp
 popq %rbx
 ret
```

Stack Structure

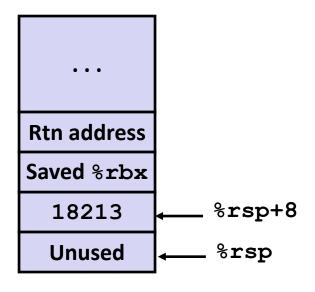

x is saved in %rbx,
 a callee saved register

long call_incr2(long x) { long v1 = 15213; long v2 = incr(&v1, 3000); return x+v2; }

```
call_incr2:
  pushq %rbx
  subq $16, %rsp
  movq %rdi, %rbx
  movq $15213, 8(%rsp)
  movl $3000, %esi
  leaq 8(%rsp), %rdi
  call incr
  addq %rbx, %rax
  addq $16, %rsp
  popq %rbx
  ret
```

Stack Structure

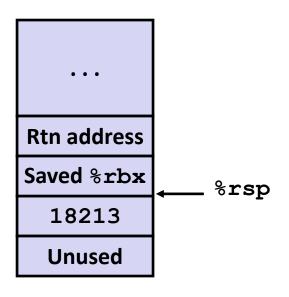

Upon return from incr:

- x safe in %rbx
- Return val v2 in %rax
- Compute x+v2:addq %rbx, %rax

```
long call_incr2(long x) {
    long v1 = 15213;
    long v2 = incr(&v1, 3000);
    return x+v2;
}
```

```
call incr2:
 pushq %rbx
 subq $16, %rsp
 movq %rdi, %rbx
 movq $15213, 8(%rsp)
 movl $3000, %esi
 leaq 8(%rsp), %rdi
 call incr
 addq %rbx, %rax
 addq $16, %rsp
 popq %rbx
 ret
```

Stack Structure

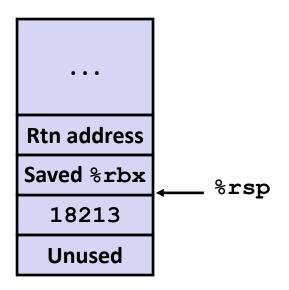

• Return result in %rax

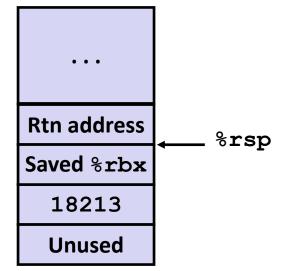

Initial Stack Structure

```
long call_incr2(long x) {
    long v1 = 15213;
    long v2 = incr(&v1, 3000);
    return x+v2;
}
```

```
call incr2:
 pushq %rbx
 subq $16, %rsp
 movq %rdi, %rbx
 movq $15213, 8(%rsp)
 movl $3000, %esi
 leaq 8(%rsp), %rdi
 call incr
 addq %rbx, %rax
 addq $16, %rsp
 popq %rbx
 ret
```

final Stack Structure

 call
        pcount r
 addq %rbx, %rax
        %rbx
 popq
.L6:
 rep; ret
```

Observations About Recursion

Handled Without Special Consideration

- Stack frames mean that each function call has private storage
 - Saved registers & local variables
 - Saved return pointer
- Register saving conventions prevent one function call from corrupting another's data
 - Unless the C code explicitly does so (e.g., buffer overflow in Lecture
 9)
- Stack discipline follows call / return pattern
 - If P calls Q, then Q returns before P
 - Last-In, First-Out

Also works for mutual recursion

P calls Q; Q calls P

x86-64 Procedure Summary

Important Points

- Stack is the right data structure for procedure call / return
 - If P calls Q, then Q returns before P
- Recursion (& mutual recursion) handled by normal calling conventions
 - Can safely store values in local stack frame and in callee-saved registers
 - Put function arguments at top of stack
 - Result return in %rax
- Pointers are addresses of values
 - On stack or global
